

Introduction

01

IoT enables easy access to cloud services but faces severe DDoS threats.

02

DDoS attacks disrupt IoT services by flooding networks with compromised devices.

IoT Expansion & Vulnerability: IoT expansion requires robust security against evolving DDoS threats

Evolving DDoS Threats: Traditional measures fall short, necessitating adaptive machine learning for dynamic threat detection.

Critical Data Security: With sensitive data at stake, ML ensures data integrity and user trust.

Objective

Detect Detect DDoS attacks in IoT environments Utilize Utilize innovative machine learning, with a focus on behavior analysis Mitigate Mitigate malicious activities causing outages and data breaches

Literature Survey

NAME	ABOUT THE DATASET	MODELS USED	RESULTS
Shahid, M., Blanc, G., Jiang, X., & Débar, H. (2018). IoT Devices Recognition Through Network Traffic Analysis. 2018 IEEE International Conference on Big Data (Big Data). https://doi.org/10.1109/bigdata.2018.8622243	A small smart home network is built to generate network traffic using four IOT devices: a Nest security camera, a D-Link motion sensor, a TP-Link smart bulb and a TP-Link smart plug. The network traffic is collected thanks to a Raspberry Pi placed between the wireless access point and the Internet	Six different classification algorithms are tested: Random Forest, Decision Tree, SVM (with rbf kernel), k-Nearest Neighbors, Artificial Neural Network (ANN) and Gaussian Naïve Bayes.	An overall accuracy of 99.9% has been achieved by the Random Forest classifier.
Patel, S., Gupta, A., Nikhil, Kumari, S., Singh, M., & Sharma, V (2018). Network traffic classification analysis using machine learning algorithms. 2018 International Conference on Advances in Computing, Communication Control and Networking (ICACCCN). https://doi.org/10.1109/icacccn.2018.8748290	Wire Shark tool was used for capturing the network packet of	K nearest neighbours, Naïve Bayes Algorithm, Decision Tree Algorithm and Support Vector Machine.	The results show that KNN is most robust among the algorithms: NB, DT, and SVM while having highest mean for accuracy of 92.4214% for K = 11
Liang, X., & Kim, Y. (2021). A Survey on Security Attacks and Solutions in the IoT Network. 2021 IEEE 11th Annual Computing and Communication Workshop and Conference (CCWC). https://doi.org/10.1109/ccwc51732.2021.9376174	Data collected from IOT devices (Edge Computing)	SVM, Random Forest and Logistic Regression.	SVM performed the best with an accuracy of 95.24% at detecting DDoS attacks
Neto, E. C. P., Dadkhah, S., Ferreira, R., Zohourian, A., Lu, R., & Ghorbani, A. A. (2023). CICIOT2023: A Real-Time Dataset and Benchmark for Large-Scale Attacks in IoT Environment. <i>Sensors</i> , 23(13), 5941. https://doi.org/10.3390/s23135941	The IoT topology was deployed to produce the CICIoT2023 dataset and comprises 105 IoT devices. A total of 67 IoT devices were directly involved in the attacks and other 38 Zigbee and Z-Wave devices were connected to five hubs to mimic a real-world deployment of IoT products and services in a smart home environment	Logistic Regression, Perceptron, Adaboost, Random Forest, and Deep Neural Network	Both Random Forest and Deep Neural Network are able to maintain high accuracy and F-1 score. These methods also present a decrease in performance but are capable of achieving F1 scores of 70%.

CRISP-DM Methodology

Business Understanding

Project Requirements

• Understand the Source IoT data

Identify the domain and formulate the problem statement

Data Understanding

Discovery of datasets for IoT DDoS attacks

Conduct EDA

Data Preparation

Data Cleaning

Data Transformation

Split of Data into Train (80%) and Test (20%)

Modeling

Develop Models

•KNN •RF

•SVM

Implement
Ensemble technique

•RF + KNN

•KNN+SVM

Evaluation

Model Validation

Evaluation Metrics

•F1 Score

Accuracy
 Confusion Matrix

Deployment

Deploy the model for final usage in Streamlit

Data

Data Source

Data is sourced from Aposemat IoT-23 which was created as part of Avast AIC laboratory ranging from 2018-2019 and was published in the year 2020

"Sebastian Garcia, Agustin Parmisano, & Maria Jose Erquiaga. (2020). IoT-23: A labeled dataset with malicious and benign IoT network traffic (Version 1.0.0) [Data set]. Zenodo.

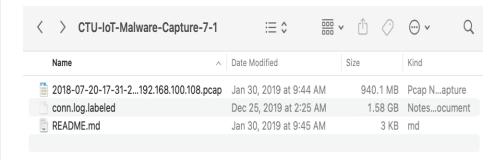

http://doi.org/10.5281/zenodo.4743746"

Data Collection

Data is retrieved from different file formats as follows:

- README.md contains info about captures and associated malwares.
- .pcap original file that has network traffic captures
- conn.log.labeled .pcap file is retrieved using Zeek network analyser with proper labelling along with some additional info

CTU-IoT-Malware-Capture-7-1 (Linux.Mirai)

LABELS DISTRIBUTION

Label	Flows
Benign	75,955
C&C-HeartBeat	5,778
DDoS	39,584
Okiru	11,333,397

LINK TO THIS DATASET FILES:

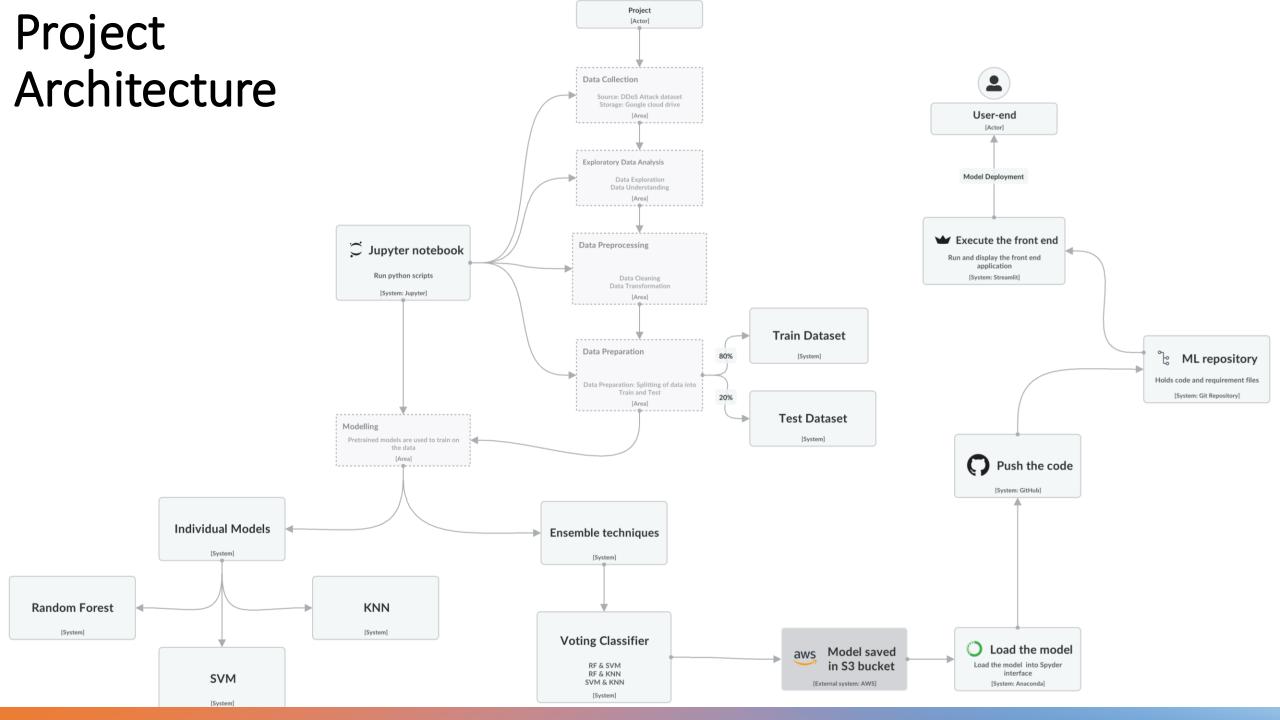

https://mcfp.felk.cvut.cz/publicDatasets/loT-23-Dataset/IndividualScenarios/CTU-loT-Malware-Capture-7-1/

About the dataset

Aposemat IoT-23

- A unique dataset capturing IoT network traffic.
- 20 malware captures on IoT devices and 3 benign IoT devices.
- Real network behaviour for research and machine learning.
- Labels provided for analysis, including attack, C&C, DDoS, and more.
- A valuable resource for IoT security and malware research.

Data Process Flow

Source IoT Data

CSV format

Data Cleansing

Drop unwanted columns

Rename columns

Handle Missing values through mean imputation

Replace '-' with nulls

Drop duplicate records

Data Preparation

80% training dataset 20% testing dataset

Null checks
Statistical distribution
Correlation of columns

EDA

Label encoding to handle categorical features

Standardize the numerical features

Bin the different attacks into DDoS and Non-DDoS

Apply RandomOverSampler to the minority class

Data Regularization

Data Transformation

Source IoT Data

Download the full IoT-23 dataset (21 GB) here:

https://mcfp.felk.cvut.cz/publicDatasets/loT-23-Dataset/iot_23_datasets_full.tar.gz

Download a lighter version containing only the labeled flows without the pcaps files (8.8 GB) here:

• https://mcfp.felk.cvut.cz/publicDatasets/loT-23-Dataset/iot_23_datasets_small.tar.gz

Download the design of how the **labels** were assigned from this spreadsheet

 https://docs.google.com/spreadsheets/d/1HRqgKJpoXoSUIfW3rCQKoD_LnSCJ1kk61PndJXWq_o/edit#gid=0

Exploratory Data Analysis

Available columns: 21

• Datatypes: object (14 columns), float64 (7 columns)

• Total records: 11,448,425

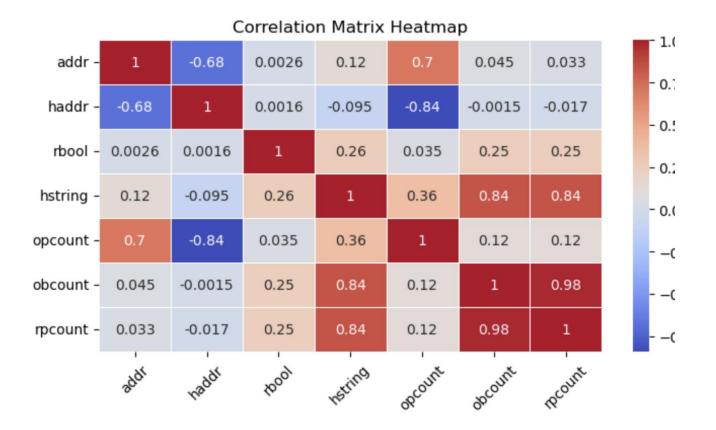

#	Column	Dtype
0	#types	object
1	t	object
2	uidstring	object
3	addr	float64
4	port	object
5	haddr	float64
6	pport	object
7	enum	object
8	sstring	object
9	interval	object
10	bcount	object
11	rcount	object
12	connstring	object
13	obool	object
14	rbool	float64
15	mbcount	object
16	hstring	float64
17	opcount	float64
18	obcount	float64

Exploratory Data Analysis

- #types has no nulls.
- T has 1 null value.
- The rest of the columns have 2 null values.

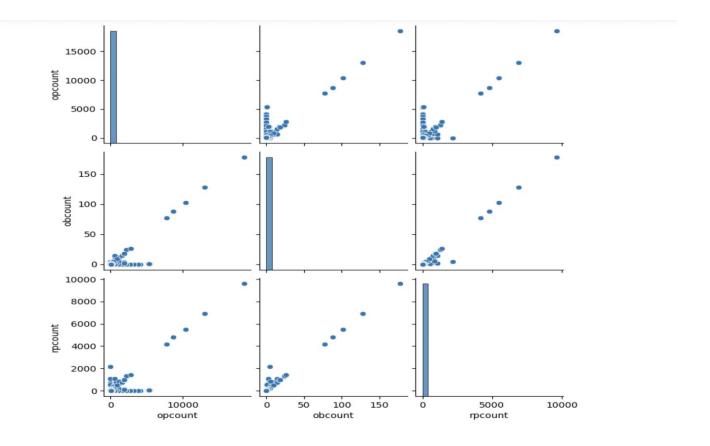

```
#types
uidstring
addr
port
haddr
pport
enum
sstring
interval
bcount
rcount
connstring
oboo1
rbool
mbcount
hstring
opcount
obcount
rpcount
ipbcount
dtype: int64
```

Exploratory Data Analysis

- Correlation matrix analysis reveals relationships among attributes related to DDoS attacks.
- 'obcount' and 'np count' show the highest correlation in the dataset.
- Understanding this correlation is crucial for shaping effective feature engineering in attack detection.

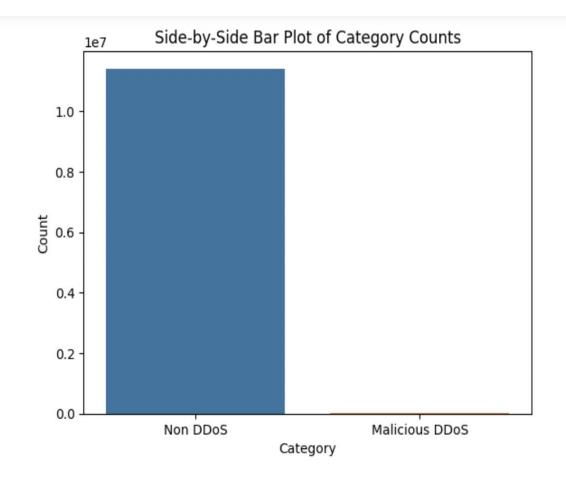

Exploratory Data Analysis

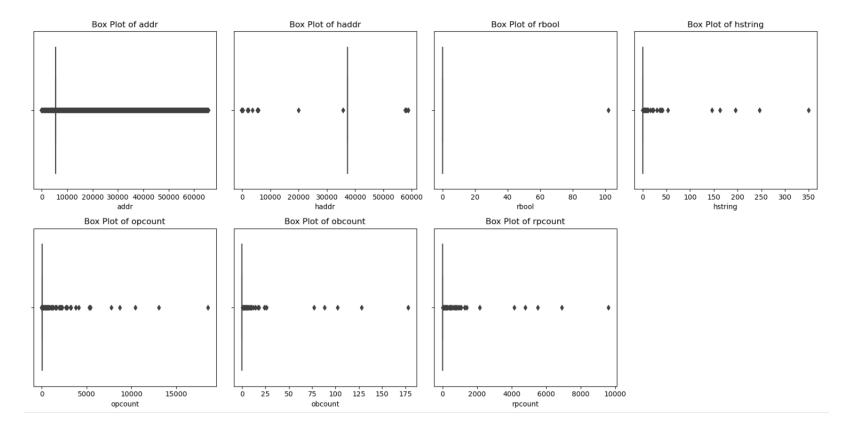

- Pair plot visualization offers insights into relationships and distributions in the dataset.
- Useful for identifying potential correlations and patterns related to DDoS attack activity.

Exploratory Data Analysis

- Bar plot categorizes data into 'Non DDoS' and 'Malicious DDoS.'
- 'Non DDoS' count is 11,408,840, and 'Malicious DDoS' count is 39,584, indicating class imbalance.
- Distribution is crucial for building effective DDoS detection models.

- Statistical distribution of values.
- For hstring, opcount, obcount, and rpcount, the values are closer to the median.
- The values for addr are spread out evenly since it is a unique identifier
- The values for haddr are spread out evenly as well.

Exploratory Data Analysis

Data Cleaning

Data before binning the Category field

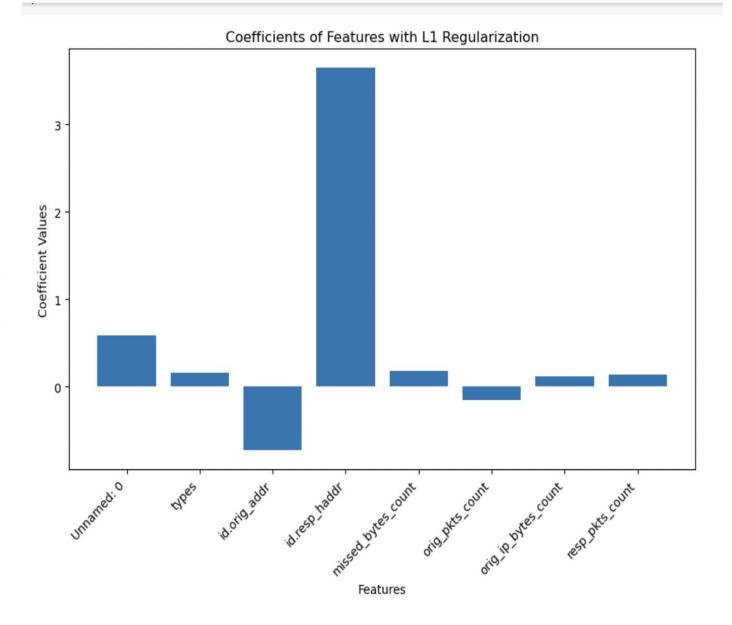

Data after binning

 Binning categorizes attacks into 'DDoS' and 'Non DDoS' using a mapping dictionary for count.

	uid_string	id.orig_addr	id.orig_port	id.resp_haddr	missed_bytes_count	history_string	orig_pkts_count	orig_ip_bytes_count	resp_pkts_count	Category

Modeling

Random Forest Classifier (RFC)

Ensemble learning for robust classification.

Captures complex relationships in data.

High performance and scalability.

Nearest Neighbors (KNN)

Instance-based learning for pattern recognition.

K-nearest neighbors influence classification.

Effective in high-dimensional spaces.

Support Vector Machine (SVM)

Maximize the margin between data points.

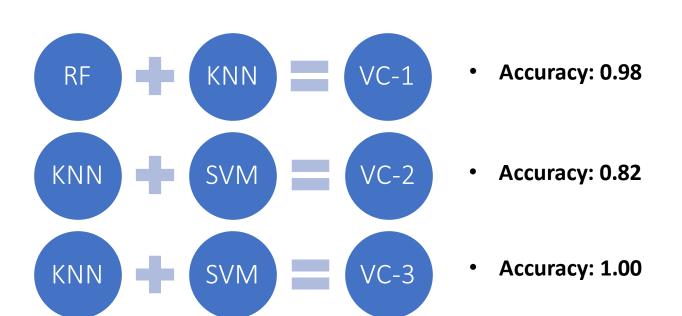

Effective for both linear and non-linear data.

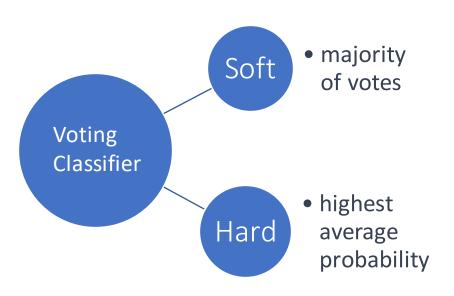

Strong in handling high-dimensional data.

Ensemble Techniques

Ensemble technique combining predictions of multiple models (classifiers).

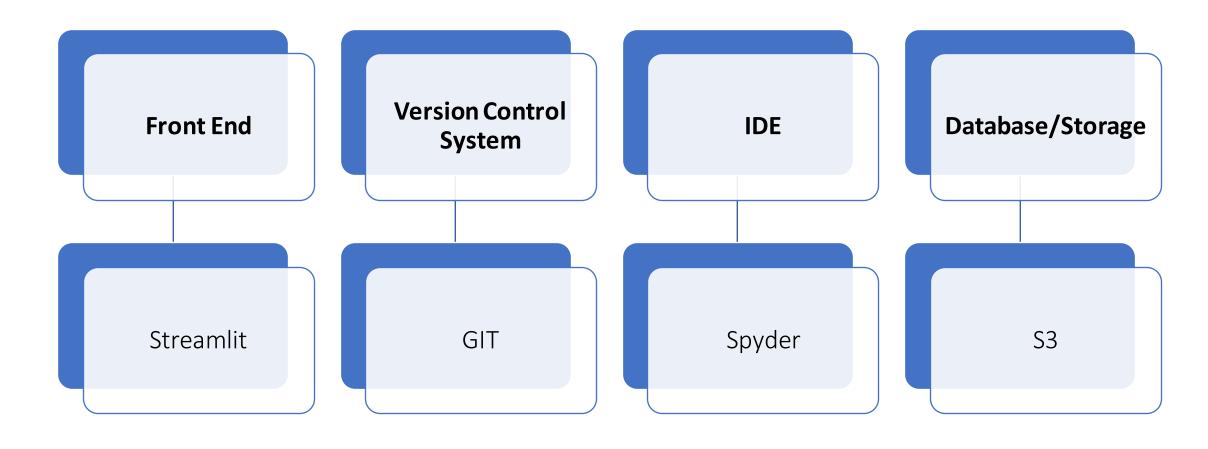

Model Deployment

DDOS Prediction Application

Conclusion

1

ML models (RF, KNN, SVM, ensembles) enhance IoT security against DDoS attacks.

2

Behavior analysis provides insights for risk identification and mitigation.

3

A preventive approach strengthens IoT security against DDoS crimes.

Assess scalability on larger datasets to recognize IoT devices.

Explore more features and strategies for IoT network behavior analysis.

Evaluate robustness under varying networks and new IoT devices.

Build backup ML security solutions to deliver reliable, protected IoT services.

THANK YOU!
